

Industrial Organization, Week 7

Price Discrimination

Dio Mavroyiannis [†]

Milestone Institute

17 March 2021

Agenda

- 1 Big picture
- 2 Definition
- 3 What is price discrimination?
- 4 First degree price discrimination
- 5 Third degree price discrimination
- 6 Second degree price discrimination

Price discrimination plan

- ▶ Plan: Price discrimination
- ▶ First we will look at what each kind of discrimination is
- ▶ How do you price discriminate?
- ▶ We look at some examples of price discrimination

Agenda

- 1 Big picture
- 2 Definition**
- 3 What is price discrimination?
- 4 First degree price discrimination
- 5 Third degree price discrimination
- 6 Second degree price discrimination

Definition

- ▶ Price Discrimination: The pricing of the same or similar goods at different levels
- ▶ Requires: No arbitrage or resale
- ▶ No resale requires either: 1) Non transferability, 2) high transaction cost, 3) Resale Illegal

Agenda

- 1 Big picture
- 2 Definition
- 3 What is price discrimination?**
- 4 First degree price discrimination
- 5 Third degree price discrimination
- 6 Second degree price discrimination

First degree price discrimination

Features:

- ▶ Every consumer charged their highest willingness to pay
- ▶ No consumer surplus
- ▶ Efficient but rare
- ▶ Linguistically: perfect price discrimination or perfect appropriation

Third degree price discrimination?

Features:

- ▶ Selection by indicator(age, sex, etc)
- ▶ Different price for each type
- ▶ Movie tickets for young or old

Second degree price discrimination?

Features:

- ▶ Self-selection by consumers
- ▶ Consumer type unknown to producer
- ▶ Example: Mobile telephone, subscription services

Types of price discrimination?

- ▶ If goods are homogenous: menu pricing over quantity
- ▶ Vertically differentiated goods
- ▶ degree of price discrimination does not necessarily entail the surplus taken

Agenda

- 1 Big picture
- 2 Definition
- 3 What is price discrimination?
- 4 First degree price discrimination**
- 5 Third degree price discrimination
- 6 Second degree price discrimination

Look into the demand

A downward sloping demand curve function can be generated by three different processes

- ① A single individual with continuous demand
- ② Many identical individuals with continuous
- ③ Heterogeneous individuals

Consumer preferences

A single consumer with continuous demand interpretation:

$$U_i = v_i q_i - \frac{q_i^2}{2} - t(q_i) \quad (1)$$

In first degree price discrimination, this equation will always equal 0 in equilibrium

The two part tariff

- ▶ A two part tariff can always lead to the monopolist extracting all surplus
- ▶ Requires a two part tariff for every type of consumer, then all producer surplus.
- ▶ $t(q) = T + pq$
- ▶ The optimal price is the welfare maximizing quantity
- ▶ The optimal subscription fee is the individual rationality equation

Two part tariff

- ▶ The monopolist chooses the welfare maximizing quantity or price
- ▶ The monopolist charges each type of consumer their exact surplus as a fixed fee
- ▶ This reasoning works when employed in other industries, lump sum taxes are efficient.

Agenda

- 1 Big picture
- 2 Definition
- 3 What is price discrimination?
- 4 First degree price discrimination
- 5 Third degree price discrimination**
- 6 Second degree price discrimination

Look into the demand

- ▶ The producer can distinguish between different kinds of demands.
- ▶ Example: Children, senior citizens, etc.
- ▶ Compared to monopoly: monopolist better off, some consumers worse off(not always)

Example:

A mini example to gain some intuition

- ▶ Suppose consumers have a WTP between $0 - 1$
- ▶ Costs of production are 0.
- ▶ Profit whilst blind: $p(1 - p)$
- ▶ Profit whilst distinguishing between upper and lower half: $p_1(1 - p_1)$ for upper half and $p_2(\frac{1}{2} - p_2)$ for lower half

Agenda

- 1 Big picture
- 2 Definition
- 3 What is price discrimination?
- 4 First degree price discrimination
- 5 Third degree price discrimination
- 6 Second degree price discrimination**

Second degree price discrimination

More uncertainty

- ▶ Consumers have heterogeneous demands
- ▶ Monopolist cannot differentiate between them
- ▶ The return of incentive compatibility
- ▶ Perfect discrimination impossible
- ▶ '3 for 2', 60p for 1m 1.20 for 3.

Example of second degree price discrimination

Suppose we have two types of consumers in equal proportions

- ▶ Utility function: $U_i = \frac{(A_i - p_i)^2}{2} - T_i$
- ▶ Suppose that $q_l = 2 - p$; $q_h = 3 - p$
- ▶ Firm sets two packages, $(p_1, T_1), (p_2, T_2)$
- ▶ Individual Rationality L: $\frac{(2-p_1)^2}{2} - T_1 > 0$
- ▶ Individual Rationality H: $\frac{(3-p_2)^2}{2} - T_2 > 0$
- ▶ Incentive compatibility of low(ICL): $\frac{(2-p_1)^2}{2} - T_1 > \frac{(2-p_2)^2}{2} - T_2$
- ▶ Incentive compatibility of high(ICH): $\frac{(3-p_2)^2}{2} - T_2 > \frac{(3-p_1)^2}{2} - T_1$

The profit function

It turns out that we only need IRL and ICH

$$T_1 = \frac{(2 - p_1)^2}{2} \quad (2)$$

$$T_2 = \frac{(3 - p_2)^2}{2} + \frac{(2 - p_1)^2}{2} - \frac{(3 - p_1)^2}{2} \quad (3)$$

$$\pi = \frac{1}{2}((2 - p_1)p_1 + (3 - p_2)p_2 + T_1 + T_2) \quad (4)$$

$$\rightarrow (p_1, T_1) = (1, 0.5) \quad (5)$$

$$\rightarrow (p_2, T_2) = (0, 3) \quad (6)$$

Result

- ▶ Option 1, low fixed cost, high per unit price
- ▶ Option 2, High fixed cost, low unit price

Conclusion

- ▶ Price discrimination increases welfare
- ▶ From first, to third, to second, the firm loses capacity to discriminate.
