Final Exam

24/1 - Probability

MILESTONE INSTITUTE – *Summer 2024*

Instructions: *Calculators are allowed; please leave the exam copies behind. Write your answers on a separate piece of paper. Show your work! Half the points will be awarded if you only write the correct answer*

1 Exercise 1 [2 marks]

A dance instructor is teaching a class of 6 boys and 3 girls, and she'd like to pair them up into boy-girl pairs. In how many different ways can she do that?

Hint: *Recall the following formulas*

$$
\begin{aligned}
&\textit{Permutations without repetition:} && && \frac{n!}{(n-k)!} \\
&\textit{Permutations with repetition:} && && n^k \\
&\textit{Combination without repetition: } C(n,k) && = && \frac{n!}{k!(n-k)!} \\
&\textit{Combination with repetition: } C(n+k-1,k) && = && \frac{(n+k-1)!}{k!(n-1)!}
\end{aligned}
$$

2 Exercise 2 [6 marks]

A factory produces electronic components, and it is known that 10% of the components are defective. A quality control inspector randomly selects 20 components from a day's production.

1. What is the probability that exactly 3 components are defective?
2. What is the probability that at most 2 components are defective?
3. What is the probability that at least 1 component is defective?

3 Exercise 3 [4 marks]

Problem: An email filtering system uses Bayesian spam detection. The system has the following performance metrics:

- The probability of correctly identifying a spam email (true positive) is 99%.
- The probability of correctly identifying a non-spam email (true negative) is 99%.
- 20% of all incoming emails are spam.

What is the probability that an email is spam, given that it was flagged as spam by the filter?

4 Exercise 4 [4 marks]

Problem: The average number of emails a person receives per hour is 4. Assuming that the number of emails received follows a Poisson distribution, answer the following questions:

What is the probability that a person receives at most 2 emails in one hour?

Hint: *Recall the following formulas* The probability mass function (PMF) of a Poisson-distributed random variable X with parameter λ is given by:

$$P(X = k) = \frac{\lambda^k e^{-\lambda}}{k!}, \quad k = 0, 1, 2, \ldots$$

5 Exercise 5 [4 marks]

Women have an average height of 166cm with a variance of 36.

1. What proportion of women have a height greater than 170cm
2. What proportion of women have a height between 160cm-176cm?

Table 1: Standard Normal Distribution z-Table

z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
